ERRORS

3 0

1 page returned a 4XX status code

1 0

About this issue: A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability.

This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it.

This usually happens due to the following reasons: 1.

DDoS protection system. 2. Overloaded or misconfigured server.

How to fix: If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: 1.

Contact your web hosting support team. 2. Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt.

1 internal link is broken

1 0

About this issue: Broken internal links lead users from one webpage to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken.

Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource.

If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.

1 structured data item is invalid

1 0

About this issue: This issue is triggered if structured data items contain fields that do not meet Google's guidelines <https://developers.google.com/search/docs/data-types/article>.

Implementing and maintaining your structured data correctly is important if you want to get an edge over your competitors in search results. If your website markup has errors, crawlers will not be able to properly understand it, and you may run the risk of losing the chance of gaining rich snippets and getting more favorable rankings.

For more information on the structured data requirements, see <https://schema.org>, Google documentation <https://developers.google.com/search/docs/data-types/article> or our article <https://www.semrush.com/kb/1084-structured-data-items-site-audit>. How to fix: Check structured data on your webpages with a validation tool. Please note that different markup testing tools may show different results.

We recommend that you use the Rich Results Test tool <https://search.google.com/test/rich-results> to review and validate your pages' structured data against their rich snippet requirements.

0 pages returned 5XX status code

0 0

0 pages don't have title tags	0
0 issues with duplicate title tags	0
0 pages have duplicate content issues	0
0 pages couldn't be crawled	0
0 pages couldn't be crawled (DNS resolution issues)	0
0 pages couldn't be crawled (incorrect URL formats)	0
0 internal images are broken	0
0 pages have duplicate meta descriptions	0
Robots.txt file has format errors	0
0 sitemap.xml files have format errors	0
0 incorrect pages found in sitemap.xml	0
0 pages have a WWW resolve issue	0
This page has no viewport tag	0
0 pages have too large HTML size	0

0 pages with a broken canonical link	0
0 pages have multiple canonical URLs	0
0 pages have a meta refresh tag	0
0 issues with broken internal JavaScript and CSS files	0
0 subdomains don't support secure encryption algorithms	0
0 sitemap.xml files are too large	0
0 links couldn't be crawled (incorrect URL formats)	0
0 pages are missing the viewport width value	0

0 pages have slow load speed

brandonmicci.com

WARNINGS

20

1 page has too much text within the title tag

10

About this issue: Most search engines truncate titles containing more than 70 characters. Incomplete and shortened titles look unappealing to users and won't entice them to click on your page. For more information, please see this Google article: <https://support.google.com/webmasters/answer/35624>.
How to fix: Try to rewrite your page titles to be 70 characters or less.

1 page has low text-HTML ratio

10

About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content.
That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster.
How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.

0 external links are broken

00

0 external images are broken

00

0 links on HTTPS pages lead to HTTP page

00

0 pages don't have enough text within the title tags

00

0 pages don't have an h1 heading

00

0 pages have duplicate H1 and title tags

00

0 pages don't have meta descriptions

00

0 pages have too many on-page links

00

0 URLs with a temporary redirect

00

0 images don't have alt attributes	0
0 pages have too many parameters in their URLs	0
0 pages have no hreflang and lang attributes	0
0 pages don't have character encoding declared	0
0 pages don't have doctype declared	0
0 pages have a low word count	0
0 pages have incompatible plugin content	0
0 pages contain frames	0
0 pages have underscores in the URL	0
0 outgoing internal links contain nofollow attribute	0
Sitemap.xml not indicated in robots.txt	0
Sitemap.xml not found	0
Homepage does not use HTTPS encryption	0
0 subdomains don't support SNI	0
0 HTTP URLs in sitemap.xml for HTTPS site	0
0 uncompressed pages	0

0 issues with blocked internal resources in robots.txt

0 0

0 issues with uncompressed JavaScript and CSS files

0 0

0 issues with uncached JavaScript and CSS files

0 0

0 pages have a JavaScript and CSS total size that is too large

0 0

0 pages use too many JavaScript and CSS files

0 0

0 issues with unminified JavaScript and CSS files

0 0

0 link URLs are too long

0 0

NOTICES

50

3 pages have only one incoming internal link

30

About this issue: Having few incoming internal links means little to no visits or chances of being placed in search results. AI search engines use internal linking patterns to understand content importance and relationships within your site's knowledge network. Pages with few internal links may look less authoritative to AI algorithms and reduce your content's visibility and citation potential.

How to fix: Add more incoming internal links to pages with important content.

1 page has more than one H1 tag

10

About this issue: Although multiple <h1> tags are allowed in HTML5, we still do not recommend that you use more than one <h1> tag per page. Including multiple <h1> tags may confuse users. How to fix: Use multiple <h2>-<h6> tags instead of an <h1>.

lms.txt not found

10

About this issue: The lms.txt file helps AI search engines better understand your website's content by providing LLM-friendly information. This file offers a short summary, guidance, and links to other useful resources. How to fix: 1.

Create an lms.txt file. 2. Place it in your website's root directory and ensure the file is accessible.

3. Refer to lms.txt.org for examples and tips on how to properly create and manage it.

0 pages are blocked from crawling

00

0 page URLs are longer than 200 characters

00

0 outgoing external links contain nofollow attributes

00

Robots.txt not found

00

0 pages have hreflang language mismatch issues

00

0 subdomains don't support HSTS

00

0 orphaned pages in Google Analytics

00

0 orphaned pages in sitemaps

00

0 pages blocked by X-Robots-Tag: noindex HTTP header	0 0
0 issues with blocked external resources in robots.txt	0 0
0 issues with broken external JavaScript and CSS files	0 0
0 pages need more than 3 clicks to be reached	0 0
0 URLs with a permanent redirect	0 0
0 resources are formatted as page link	0 0
0 links on this page have no anchor text	0 0
0 links have non-descriptive anchor text	0 0
0 links to external pages or resources returned a 403 HTTP status code	0 0
lms.txt has formatting issues	0 0
0 pages contain too much content	0 0
0 pages have outdated content	0 0
0 pages have low semantic HTML usage	0 0

4xx errors

- i** About this issue: A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability. This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons: 1. DDoS protection system. 2. Overloaded or misconfigured server. How to fix: If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: 1. Contact your web hosting support team. 2. Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt
